

WEEK 8: STUDENT PERFORMANCE DASHBOARD

Done by: Deepika J Roll No:E25DAO08

1. Introduction

The Student Performance dataset was used to develop an interactive dashboard in Power BI. The dashboard presents student score information through cards, charts, and comparison visuals. It helps to understand overall performance and identify differences across subjects and other student-related categories.

2. Objective

The main objective of this activity is to create a clear and interactive Power BI dashboard for analysing student performance. The report focuses on displaying important score measures, comparing subject-wise performance, and presenting the available data in an easy-to-understand visual form.

3. Dashboard Preparation

The prepared Student Performance data was loaded into Power BI and the required fields and measures were used to build the dashboard. Summary cards were added to display key score values, while different visuals were arranged to compare scores by subject, parental education, and Pass/Fail status.

4. Visuals Used

The dashboard contains several visual elements such as score summary cards, a distribution chart, subject-wise charts, a doughnut chart, and comparison charts. These visuals provide different views of the same dataset and make the analysis easier to interpret.

5. Dashboard Analysis

The dashboard shows an overall average score of 67.8 along with other summarized score measures. The visuals allow the user to compare Math, Reading, and Writing performance and observe how average scores vary across parental education categories. Pass/Fail-based comparisons are also included for a broader view of performance.

6. Output

The completed Power BI dashboard provides a visual summary of student performance. The following pages provide space for the three individual chart screenshots, followed by the complete dashboard screenshot.
